

A presentation by Dipa Cham Myae and Hamza Nasher-Alneam

Suckless software

What it is, why you should
use it, and how to get
started

With some extra
information on Systemd
and its alternatives!!

Modern software SUCKS

- Systemd
- vim
- Microsoft Windows
- Systemd
- HTTP
- c++
- GNOME
- Systemd
- Microsoft Edge
- Systemd
- Systemd
- Bash
- IntelliJ (jk)
- Systemd
- Systemd
- GCC
- Python
- ChatGPT
- Systemd
- Libadwaita
- Systemd
- Steam
- Blackboard
- Systemd

Philosophy

- Software should be as small and simple as possible.
 - Do one thing well
 - Code should be readable and understandable
 - Avoid unnecessary dependencies
 - You're expected to modify the source yourself instead of relying on endless config options
(seen in other suckless projects)
-

Suckless projects

Dwm

- Dynamic window manager for x11
- Built on C
- Very low memory usage
- Minimal features

ST

- Simple terminal
- Minimal and efficient terminal
- Extremely fast load times
- No other terminal is this efficient
- Scrolling is not baked in by default (bloat)

Suckless isn't just an organization – it's a philosophy. It's about building tools that do only what they need to do, without any BLOAT (call out to systemd) or unnecessary features (call out to scrolling in terminal emulators), resulting in minimal install sizes and blazingly fast applications that fully utilize the power of modern technology

More at: <https://suckless.org/philosophy>

What to use instead of sucky software?

Ubuntu -> Alpine Linux

Hyprrland -> dwm

Free market -> control economy

Wayland/X11 -> Write your own

Windows 7/10/11 -> Gentoo

MacOS -> Void Linux

Copilot -> Local LLM

C++ -> Java

GNU Coreutils -> Busybox

GCC -> cproc, lacc, tcc

HTTP -> Gopher

VSCode -> Vi

Emacs -> Vi

Nano -> Vi

JetBrains editors -> Vi

Microsoft Word -> Vi

Vim -> Vi

Wordpress/Notepad -> Vi

Why the passion?

We're sick of your disgusting modern software - we believe any project must follow the UNIX principles:

- Do one thing well (like only being an init system)
- Use plain text instead of a proprietary format (eg txt or Markdown)
- Fail early and noisily (make user know something has failed, if it affects them)
- The other ones

Book recommendations

Read these maybe

GPLv2 vs GPLv3 - what's the difference?

GPLv2 includes all the things we know and love about open source, while v3 includes clauses to prevent something called tivoization. RMS pushed for this, and nobody loves RMS his own mother probably hates him and GNU is bloated and doesn't follow the UNIX principles and Torvalds mogs anyway

BAD

GPLv2

CHAD

Okay but what is Tivoization?

Tivoization is the practice of using copyleft-licensed software (like GNU GPLv2) in hardware while using technical measures, such as digital signatures, to prevent users from running modified versions of that software on the device. RMS coined the term after a company called TiVo that used GNU software but prevented users from loading modified versions onto their digital video recorders by only accepting signed versions. Stallman believed this was against the spirit of the license as it indirectly violates one of the core software freedoms, whereas Linus was okay with it, favoring a more permissive stance.

Linus discussing his license choice ->

FOUR SOFTWARE FREEDOMS

0. The freedom to run the program as you wish, for any purpose.
1. The freedom to study how the program works, and change it as you wish.
2. The freedom to redistribute copies.
3. The freedom to distribute copies of your modified versions.

Source code access is a precondition for freedoms 1 and 3

What is an init system?

The init systemd is the first process started once the kernel loads, that is given PID 1, and then goes on to start the other essential daemons (background services, eg sshd). It will also manage these services and “adopt” any processes that have their parents unexpectedly die, and when the shutdown command is issued, stop all processes. This is what a normal init system does, and when it focuses on just this, it does it well.

A bloated sucky init service would take on many more roles in an attempt to control Linux, like the device management (udev), networking (networkd), logging (journald), login management (logind), time sync service (timesyncd), and even the bootloader (boot). Yes, we’re talking about systemd, which has continually tried to take on more and more roles that were previously done by single services.

Systemd is literally the devil

One of the core UNIX principles is “do one thing and do it well”

Systemd took a look at that and said “hell no”

Satan uses Systemd/Linux with the systemd-bootd and
systemd-timesyncd, systemd-loggingd, systemd-kernel

Systemd also made PID 1 extremely bloated. PID 1 has way too
much stuff going on

Systemd logs are binary logs not text logs

Who even thought “oh we should use binary logs for our logging”?

More bloat like parallel boot

The underlying fact is that systemd does way too many things, and none of them well. For example, journald, the systemd logging tools, stores logs in a proprietary (eww) binary format, so it can only be read by the systemd tools, which is a violation of the UNIX principle of storing data in plaintext.

Lennard Pottering, Systemd developer

What should I use instead?

openrc

Used by alpine, others, cool

OpenRC is a dependency-based init system that is most famous for being the default on Gentoo and Alpine Linux. It is often seen as a "middle ground" between the old-school scripts and modern managers.

dinit

It's an init system

dinit is a newer contender (used by Artix Linux) that attempts to combine the best of both worlds: the modern dependency tracking of systemd with the simplicity of the Unix philosophy.

runit

It's an init systemd

runit is a minimalist's dream. It is a cross-platform init scheme that focuses on "code correctness" and a tiny footprint. It is the default for Void Linux.

What distros ship with these by default?

Alpine Linux (containers)

Gentoo (Chromeos base)

Artix Linux (xlibre, explain)

Devuan (Debian without systemd)

gentoo linux™

DEVUAN
